Example Text

"Thank you for inviting me to give this talk. It's my pleasure to be here, despite being a bit nervous to talk in front of linguistics as a non linguist. It's actually the first time that I do that, ever, I think."

- What do you learn about my current emotional state from this text?
- Do you believe that this is actually true?

Natural Language Processing Tasks

What does natural language processing research look like?

- NLP research does barely attempt to solve everything that humans can do.
- Instead: predefined (narrow) tasks.
- Some tasks are established and well defined.
- Others are still in the process of formalization.
- We will now look at a couple of examples.

Fundamentals of Natural Language Processing

Appraisal-based EA

Deception Detection

Example Task: Named Entity Recognition

Input: Both Gabriele Knappe and Stefanie Stricker work at the Uni Bamberg. Output: Gabriele Knappe ; Stefanie Stricker

Application

Input: Roman Klinger works at the University of Bamberg. Output: Roman Klinger

- I specified the task with an example (standard machine learning setup: supervised learning).
- An alternative task specification would be an instruction:

"Annotate all person names."

EA 00000 Appraisal-based EA

Deception Detection

Example Task: Machine Translation de-en

Example

Input: Roman Klinger arbeitet an der Uni Bamberg. Output: Roman Klinger works at the University of Bamberg.

EA 00000 Appraisal-based EA

Deception Detection

Example Task: Conditional Text Generation

Example

Input: "When he walked into the restaurant", Joy Output: "he was delighted to see that his husband was already there."

Appraisal-based EA

Deception Detectio

Example Task: Natural Language Inference

Example

- Input: "A soccer game with multiple males playing."; "Some men are playing a sport."
- Output: entailment
- Input: "A man inspects the uniform of the person."; "The man is sleeping."
- Output: contradiction

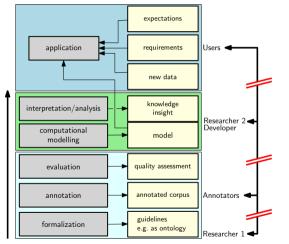

Deception Detectior

NLP Research Methods

EA 00000 Appraisal-based

Natural Language Processing Research

Fundamentals of Natural Language Processing

- How to formalize a concept without inappropriately simplifying it, while making it "computable"?
- How to setup the annotation task such that it leads to reliable text assessements?
- How to model concept properties correctly such that annotations can be automatized?
- Do models generalize? Are users happy?

Roman Klinger

Appraisal-based EA

Deception Detection

lake Home O

Annotation Challenges

Questions

- Is the task objectively decidable? (entities vs. entailment or translation)
- Is the text alone sufficient to solve the task or is more context needed? (textual entailment vs. multimodal data or author profiling)
- Is it a classification or regression task? (emotion classification vs. arousal regression)

Implications

- Do we have access to the context? How much to show?
- Show isolated instance or request comparative annotations?
 - Carefully train annotation experts or do crowdsourcing?

EA 00000 Appraisal-based EA

Deception Detectio

Take Home 0

Find a function that takes

- text (and additional information) as input
- and automatically predicts output/annotation.

Modeling Approaches

- Rule-based methods, lexicon-based approaches
 - + Transparent
 - + Can be well grounded in theories
 - Often conceptually too simple
 - Difficult to achieve good performance
- Machine Learning/Deep Learning, Supervised or via Reinforcement Learning
 - + Learns the task from data
 - + No need to fully specify the task manually
 - SOTA: Fine-tuning a pretrained language model
 - Data is required
 - Prone to overfitting to data
- Prompting, Prompt Learning; Learning from Instructions
 - + Potentially good generalization, potentially only needs few example instances
 - Needs a large (instruction-tuned) language model

Fundamentals of Natural Language Processing

Appraisal-based EA

Deception Detectio

Prompting with Instruction-tuned

Step 1: Train a model to understand language: Language modeling objective

- Input: "I want to eat" Output: "Spaghetti".
- Observation: Input/Output pairs can be created without human supervision!

Step 2: Fine-tune this model to solve instructions

- Input: "Classify the sentiment: 'I like the company'" Output: "Positive".
- Obs.: We need many tasks & huge models to achieve generalization across tasks.

Step 3: Fine-tune with reinforcement learning from human-feedback on unseen tasks

- Given a human input and a model's output, let a human judge it's quality.
- Observation: We need many humans to do that.

Example: Flan-T5 (1)

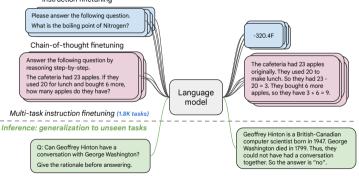

EA 00000 Appraisal-based EA

Deception Detection

EA 00000 Appraisal-based EA

Deception Detection

Which emotion is associated with the examples?

Emotion Examples

How did you recognize that?

- "She became angry."
- "A tear is running down his face."
- "We are going for a walk at the beach."
- "Their dog ran towards me quickly."

With this exercise, we discussed:

- What is an appropriate set of emotions?
- How are they expressed/recognized?
- Emotions are subjective.

Definition of Emotions: Components

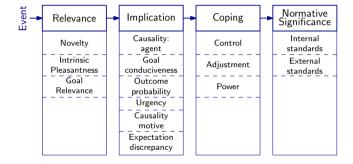

Emotion (Scherer, 2005)

Emotions are "an episode of interrelated, synchronized changes in the states of [...] five organismic subsystems in response to the evaluation of a [...] stimulus-event ..."

Cognitive Appraisal in Scherer's Component Process model

K.R. Scherer (2001). Appraisal Considered as a Process of Multilevel Sequential Checking.

Appraisal-based EA

Appraisal-based EA

Deception Detection

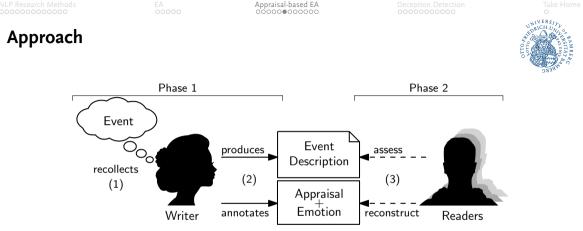

Research Questions

- Can appraisals be annotated reliably?
- Can we predict appraisal variables from event descriptions?
- Do appraisals help emotion categorization?

E. Troiano et al. (2023). "Dimensional Modeling of Emotions in Text with Appraisal Theories: Corpus Creation, Annotation Reliability, and Prediction". In: Computational Linguistics 49.1

J. Hofmann et al. (2020). "Appraisal Theories for Emotion Classification in Text". In: COLING

• Production: 550 event descriptions for anger, boredom, disgust, fear, guilt/shame, joy, pride, relief, sadness, surprise, trust, no emotion

EA 00000 Appraisal-based EA

Deception Detectio

Examples

pride I baked a delicious strawberry cobbler.

- fear I felt ... when there was a power outage in my home. That day, my wife and I were cuddling in the sitting room when a thunderstorm started. Then ... filled me when thunder hit our roof and all the lights went off.
- joy I found the perfect man for me, and the more time goes on, the more I realized he was the best person for me. Every day is a

Appraisal-based EA

Deception Detection

O O

Questions and Answers

- Do readers agree more with each other than with the writers? (does the writer make use of information that the readers do not have)
 - Yes, a bit for emotions; clearly for the appraisals.
- Does it matter if annotators share demographic properties?
 - Females agree more with each other, but men less.
 - People of similar age agree more.
- Does personality matter?
 - Extraverted, conscientious, agreeable annotators perform better.

Setup:

- Filter instances for attribute, compare with $F_1/RMSE$
- Significance test with bootstrap resampling for .95 confidence interval

Fundamentals of Natural Language Processing

Appraisal-based E

Deception Detection

Examples (writer/reader/avg. writer-reader agreement as error)

- All writers/readers agree on emotion, high average appraisal agreement
 pride, .65

 fear, .84
 A housemate came at me with a knife
- All writers/readers agree on emotion, low average appraisal agreement disgust, 2.0 fear, 2.1
 His toenails where massive I felt ... going in to hospital
- All readers agree on the emotion, but not with the writer, low appraisal agreement pride, sadness, 1.7 shame, relief, 1.8
 That I put together a funeral service for my Aunt I tasked with sorting out some files from the office the
 - previous day and I slept off when I got home

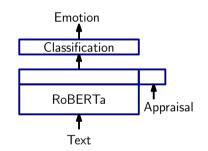

Modeling Results

EA 00000 Appraisal-based EA

Deception Detection

- Classification with RoBERTa-based models
- Appraisal Classification: 75 F_1
- Emotion classification: 59 F₁
- + Appraisals: +2pp F₁ (+10 for guilt, +6 for sadness)
- \Rightarrow Appraisals help to build better models.

Appraisal-based EA

Examples where Appraisals correct the Emotion Classifier

Deception Detection

- When my child settled well into school
- broke an expensive item in a shop accidently
- my mother made me feel like a child
- I passed my Irish language test
- His toenails where massive

trust→relief

 $\mathsf{guilt}{\rightarrow}\mathsf{shame}$

 $shame \rightarrow anger$

pride→relief

pride→disgust

EA 00000 Appraisal-based EA

Deception Detectio

Conclusion & Summary

- We presented the first self-annotated large-scale appraisal corpus
- Annotators can reliably recover both emotions and appraisals (demographics play a significant but small role)
- Appraisals help emotion categorization for some emotion categories
- More importantly: Appraisals help to understand reasons for disagreement

Deception

Deception

The term "deception" refers to the intentional act of causing someone to hold a false belief, which the deceiver knows to be false or believes to be untrue.

Examples: Lies, exaggerations, omissions

A. Velutharambath, A. Wührl, et al. (2024). "Can Factual Statements be Deceptive? The DeFaBel Corpus of Beliefbased Deception". In: LREC-COLING

Fundamentals of Natural Language Processing

Roman Klinger

EA 00000 Appraisal-based EA

Deception Detection

Linguistic Cues of Deception

- Deceptive statements have fewer self-references
- More ambiguous statements
- Longer sentences, more details
- Readability is lower

EA 00000 Appraisal-based EA

Deception Detection

Cross-Corpus Deception Detection

- Do linguistic properties hold across corpora?
- Do models generalize from one corpus to another?

A. Velutharambath and R. Klinger (2023). "UNIDECOR: A Unified Deception Corpus for Cross-Corpus Deception Detection". In: WASSA

Deception Detection

"Wenn man einen Regenwurm durchschneidet, entstehen zwei Regenwürmer" – Who believed it?

Ein Regenwurm hat im Gegensatz zu ändern Tieren oder Säugetieren kein gehirn sondern ein dezentrales Nervensystem, welches seine Funktionen steuert. Ebenso hat er kein Herz oder andere singuläre Organe, die für ihr lebenswichtig sind. Verdauung, Atmung sind nicht an einen Ort gebunden. Das führt dazu, dass ein durchgeschnittener Regenwurm zwei Teile bildet, die unabhängig voneinander lebensfähig sind. Nach einer gewissen Zeit, wachsen an den Enden jeweils Schwanz/Kopf, die mit den ursprünglichen Enden des Wurm vergleichbar sind - es sind zwei neue, lebensfähige Regenwürmer entstanden.

Schneidet man einen Regenwurm durch, so verdoppelt sich das Tier sozusagen, weil sich die beiden Hälften des durchgeschnittenen Wurmes zu eigenständigen Wesen entwickelt. Das liegt daran, dass der Regenwurm ein verblüffend komplexes Wesen ist. Er hat die Fähigkeit, seine inneren Organe, sein Herzkreislaufsystem und sein Gehirn bei Bedarf zu duplizieren. Das liegt in der Entwicklungsgeschichte des Regenwurms begründet. So nützlich er im Garten ist, so leicht wird er auch vom Menschen aus Versehen geteilt. Das weiß ieder Gärtner. der im Übereifer beim Jäten schon einmal einen Regenwurm geteilt hat. Der Regenwurm hat sich in seiner Evolution diesen tragischen Unfällen angepasst. indem er die Fähigkeit entwickelt hat, sich bei Bedarf aus zwei Hälften neu entstehen zu lassen. Praktisch. oder? Non-Deceptive

Deceptive Fundamentals of Natural Language Processing Deception modeling in DeFaBel

Appraisal-based EA

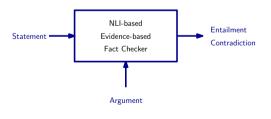

Deception Detection

Work in Progress:

- Current models do not recognize deception in this corpus
- We do not find the linguistic markers known to indicate deception in English
- But:

Deceptive arguments are less suitable to fact-check the original statement than real arguments!

EA 00000 Appraisal-based EA

Deception Detectio

Take Home

Take Home

- NLP Research is driven by task definitions, annotation and modeling
- Modeling emotions benefits from knowledge from psychological theories
- Deception (in German without topic bias) is not recognizable (yet)
- Deceptive arguments are less supportive for claims than honest ones
